«Buildings have an incredible impact on those who live and work inside them. People are happy and peaceful when they live in a place that was designed according to their way of life and the context. Far too often, «sustainable» buildings are horribly complex, ugly, and expensive. And, in the end, it is not so clear that these buildings are very ecological. We are all interested in problems of thermal efficiency and passive buildings—but veritable green architecture is much more than just finding solutions to engineering problems. Instead, the relationship between a building and its environment is the most important question. Truly green architecture must respect geography, history, and people. That is, in short, context.» Edouard François, architect and urbanist, Chevalier des Arts et des Lettres, Paris
